

KJV 1611 Exclusive Corpus Dataset and Future Analysis Framework

KJV 1611 / KJV 1769 Semantic Drift Study

Purpose

This document defines the dataset and methodological foundation for analyzing the KJV 1611 exclusive corpus while deferring formal H4 testing to a separate follow-on study. It preserves methodological clarity between aligned pair drift analysis and unaligned embedding space topology analysis.

Scope and Positioning

The current study focuses on aligned text unit pairs and tests semantic stability, tail drift, and category structure for the shared canon. The KJV 1611 exclusive corpus introduces a different analytical problem because it lacks one-to-one KJV 1769 counterparts. Its analysis requires nearest-neighbor or topology-based methods rather than paired drift comparison.

Dataset Definitions

The shared canon corpus contains units present in both KJV 1611 and KJV 1769 and is used for H1 through H3. The KJV 1611 exclusive corpus contains units present in KJV 1611 but absent from KJV 1769. Both corpora retain consistent structural identifiers where applicable.

Embedding Space Consistency

Future H4 analysis requires that exclusive-corpus and shared canon vectors occupy the same embedding space, use the same model and dimensionality, and preserve representation specific preprocessing. No cross-representation mixing is permitted.

Future Nearest Neighbor Framework

For each KJV 1611 exclusive unit, future analysis will compute distances to shared canon units and identify nearest neighbors. The analysis will summarize nearest neighbor distance, concentration by work, thematic clustering, and semantic region membership. A random sampling baseline can then estimate whether exclusive units occupy structured semantic neighborhoods rather than arbitrary positions in embedding space.

Separation from Current Study

The present study inventories the KJV 1611 exclusive corpus and validates its preservation in the InterLink workflow. It does not compute nearest neighbor results, execute H4 hypothesis tests, or report H4 p-values or effect sizes.

Research Roadmap Integration

The exclusive corpus framework establishes a second research track that can later extend to apocryphal literature, Second Temple literature, the Dead Sea Scrolls, early Christian literature, later translation traditions, and cross corpus semantic mapping.

Study Decisions

Component	Study Decision
H4 execution	Deferred to future study
Current deliverable	Exclusive corpus inventory
Direct drift scoring	Not performed for exclusive units
Future method	Nearest neighbor and embedding topology analysis
Embedding requirement	Same model, same vector space, representation specific pipelines
