

Text Unit Definition and Alignment Strategy

KJV 1611 / KJV 1769 Semantic Drift Study

Purpose

This document defines the text-unit granularity and alignment strategy used for drift scoring. It formalizes how InterLink identifies paired units using work codes, division identifiers, text fields, and vector payloads.

Text Unit Definition

The primary analysis unit is a single verse level text_unit as represented in the relational database feed and Qdrant payloads. A text unit is identified by work_code, division_level_1, and division_level_2 and is associated with text_raw and text_norm values.

- unit_key = (work_code, division_level_1, division_level_2)
- point_identity = (canon_id, work_code, division_level_1, division_level_2)

Alignment Rule

A text unit is considered aligned only when the same unit_key exists in both KJV 1611 and KJV 1769. A valid aligned pair is therefore the KJV 1611 instance of the unit_key paired with the KJV 1769 instance of the same unit_key. Only aligned pairs are eligible for direct drift scoring.

Inclusion and Exclusion Criteria

A text unit is included in drift scoring when both canon records exist in the relational database, both division identifiers are parseable as integers, both raw text fields are nonempty, and the required representation vectors exist for the representation under analysis.

A unit is excluded when it is missing on either side, is not verse-like, contains empty or whitespace only text, duplicates a structural key, or represents known non-scripture front matter. Excluded units are routed to the coverage and exception reporting layer rather than forced into alignment.

Edge Case Policy

Edge Case	Policy	Output
Verse numbering mismatch	No forced alignment is performed.	alignment_exceptions.jsonl
One-to-many verse correspondence	The case is excluded from direct drift scoring.	alignment_exceptions.jsonl
Duplicate unit keys	The case is treated as a data integrity error and excluded.	alignment_exceptions.jsonl or data integrity log
Missing representation vector	The case is excluded for the affected representation and logged as a coverage gap.	alignment_exceptions.jsonl

KJV 1611 Exclusive Work Handling

When a `work_code` is present in KJV 1611 but absent from KJV 1769, none of its units are eligible for direct aligned drift scoring. Those units are assigned to the KJV 1611 exclusive partition and preserved for future descriptive and nearest-neighbor analysis.

Study Decisions

Component	Study Decision
Primary analysis unit	Verse-level text_unit
Alignment key	work_code, division_level_1, division_level_2
Alignment rule	The same unit_key must exist in both KJV 1611 and KJV 1769
Forced alignment	Not permitted
Exception logging	alignment_exceptions.jsonl

Expected Output Artifacts

- alignment_exceptions.jsonl
- canonical_analysis_records.csv
- drift_pairs.csv
